Schizophrenia and Vertex-coma

#####

„All informations are there, but nobody how shares it correctly“ - like the german music band Welle Erdball would said it.

And so its with science – because nearly nobody has the idea to think so different, that a new point of view comes out – with the sense of the beginning

#####

1. What is schizophrenia

Schizophrenia is in modern theorys a to much of dopamine in the brain. Dopamine is for learning and handling of informations.

Schizophrenia has a lot of meanings, from short differents in point of view of reality like smelling of things that arent there till to full getting insane and to lost reality – or even to have fear that somebody is after the client.

Modern science says schizophrenia comes on two ways: one way is from tumors, the other way is to get it through stress.

But I think the stuff with the stress is bullshit – and the factor with dopamine isnt the whole theory –

there is also a theory that dopamine productions get high from other factors and that its not the reason for schizophrenia on non biological ways.

#####

2. Whats about the stress?

Lets write a true stuff about stress – its ot the real point – like on my own experience I know its not the stress – its more a complete going away from reality – through a missig link between own experience and reality.

And this could go into a coma – vertex-coma.

#####

3. Theory of vertex-coma

Vertex-singals or vertex-level is between beeing awake and state of dreaming.

What would be, if schizophrenia isnt a „psychotic episode“, more a transformation of brain into state of sleeping with open eyes. That would explain hallucinations like people with no sleep get.

That means it could be logical to forget things of „psychotic episode“, because it was a „dream“ while beeing awake.

#####

4. How vertex-coma happens

A longer turn away from the own path, like a rebellion or wrong doings could fall into a big inner conflict. That can be showed in different acting from usual ways – that could be a sign for early illness.

That means the client knows whats going on, but to protect himself he isnt going on it – and he dont know how to help himself, because the client never learned. Even to get help is hard, because the state that the client is on, is „normal“ for him or turns into normal point of view.

#####

5. Harmless endings

Harmless endings of conflicts could be a depression, or a „normal“ mania without „psychotic“ content.

But if its getting stronger, „war“ happens.

#####

6. What happens when „war“ happens

When „war“ happens, client cant handle the conflict anymore and he starts to go away from reality.

Thats why vertex-state starts, and earth is beeing viewed at another point of view – it comes to the typical „psychotic“ elements of schizophrenia.

But what that means isnt like beeing in reality – its a dream that starts. On one side it can be a wonderfull feeling like an LSD trip – on othe other side it can be pure insane.

The working of LSD and dopamine is in the same parts of brain – so here is a familier point for dopamine theory – BUT it can be also because of dreaming.

If a depression comes into vertex-coma or what science called schizophrenia – it can also be that dopamine is less in use in depression phase – and now there is to much and it goes into vertex-coma.

Clients starts now to build a dream world – autonome from any controll – because he doesnt know that its more a dream, he takes all what his senses gave him into a logical order – like acting in a dream at night.

A point for this is for example the autistic part of „psychotic episodes“.

#####

7. Factors for going into vertex-coma

#####

A factor for going away from reality can be to have that point of view – that the world is „over powerfull“ and feelings for beeing alone in this world – so client is no longer able to handle problems.

Doesnt matter if tests at school or other experience in life – if the mind of client doesnt agree – and if the point of view is to big – it comes to an invisible conflict.

This would be a big conflict – but not really – because normaly clients dont see it in that way – thy just dont agree with the stuff.

So it would be usefull to think about if what the doing is and what the will is – if there is a base for both.

#####

8. Drugs and „psychotic episodes“

A big factor for „psychotic episodes“ are drugs – most of it use of mariuhana.

Every „trip“ is the sign of dying brain cells – with strong marijuaha its most of it a coma based state of brain – where clients think to solve problems.

But there is a big stress factor – coming down again from drugs.

Now its not normal stress – its more the will to stay away from reality – that means the client doesnt come back from drug episoe and starts to have fear – like „will I ever be clear again“ - even he is clear. But marijuana and other stuff turned strong in last years – so trip can be longer – and the feeling for beeing normal could fly away.

So the stress factor isnt the drug for itsself – its more the coming clear again with the inner-self and with the world.

With drugs you can feel alone very strong – or even feel that your connected to all – but both can be a problem while becoming clear again,

#####

9. Why the way into coma?

To know why clients go into vertex-coma is based on the question for what a coma is – like an artificial coma, for example with a lot of marijuana, it helps body to solve problems, to calm down.

That means pain are less in sense and it comes to a big feeling for positve or negative seses – that can help to solve problems.

But if this goes to much – like in psychotic episodes it seems that thinking is automaticly – a coma at state of awake is dangouros.

So mind says „good bye“ to reality and brings body into another level – like I wrote before its a dream world that starts to exist for the client.

In this world „normal“ pain or dis-agretment isnt existing any longer – a short reality comes up for client and he starts to live in.

#####

More factors of vertex-coma

With my own experience I can say that Vertex-Coma is something new – that wasnt discovered till now.

Like I could say that I have the negative symptoms of „psychotic episode“ before I turned „insane“ - so my speech was with less words and a lot of things – before I turned crazy. So it was more a depression, that turned into a vertex-coma or „psychotic episode“.

I couldn't learn stuff very good and I didn't want to learn – or it was just in simple steps – long before turning crazy.

Vertex-Coma as a form of schizophrenia was long before I turned insane outside – but I also had it after I turned crazy and I was under medic stuff.

Now you could say that's the normal case – but like I said I was on this level before and after turning crazy – like I slept at day, a lower form of vertex-coma.

So my point of view is that vertex-coma should be more discovered for understanding schizophrenia.

Like I had it in the past – I still have daydreams – and most of it are making me fear – some worse later I will write what helps on it.

#####

12. Why is the time after vertex-coma so bad?

If you finally awake from the „psychotic episode“ or vertex-coma – all is new – the thinking is normal, but you don't know that it's the normal feeling like after a long use of illegal drugs.

And the different to a normal point of view is that most times the senses are higher – after this episode all is gray a bit.

Even daydreaming can bring you fear – my point of view is – the lower the brain activity is – the more fears from vertex-coma are coming back – hidden fears based on forgotten elements of the psychotic episode.

Like a feeling of fault and other stuff can make you sick – and powerless.

#####

13. What can help

I don't agree with science that to have less stress after these episodes are the „goal“ - like vertex-coma is a total dis-agreement with reality – from inner-mind or self and not a problem with things outside.

Vertex-coma and problems because of really bad situations that lived truth are similar to each other – because it goes away from reality – and makes reality to a nightmare in some points.

That means fear can take over.

So the way to get over it would be to become stronger – and not to give up – to find new strength in mental training – like math and other stuff. A lot of programs for concentration-training, math and an and are available for free, for mobile phones for example.

A inner „yes“ to life is the important stuff – to handle reality better and maybe to become more sensitive for inner-self.

The worst case is that life-situation is on a lower level after vertex-coma or „psychotic episode“ - most clients don't agree with it and are even in vertex-coma without to see it – just because they can't go with life situation.

For sure it needs time – but this time is a must for standing up again and to give clients freedom.

#####

14. Allway the same

A big problem for clients can be that they can't handle the new situation – and so they speak allways about same topics – don't get new interests and are starting to live in fear.

They live in fear because on one side they see that life can't go on like it was – and on the other side they have to much deadreams – most with fear.

That can be the case when clients really don't accept reality anymore – or even forgotten parts of vertex-coma can bring problems.

So its really a must to go over the stuff and to get interests again for present and future.

Without this – and without big training of mind and concentration – it can be end in a endless story.
