Pension Sponsorship and Participation: Summary of Recent Trends

Patrick Purcell, Domestic Social Policy Division

September 8, 2008

Abstract. The aging of the American population has made retirement income an issue of increasing concern to the Congress and the public. Although Americans are living longer than ever before, most retire before age 65. Moreover, while the nation's population continues to grow, the decline in birth rates that followed the post-World War II "baby boom" and the continued lengthening of life spans will result in fewer workers relative to the number of retirees. These trends will affect the economic well-being of future retirees because pensions and Social Security benefits will be paid over longer periods of time; savings will have to be stretched over longer retirements; and Social Security benefits will have to be financed by a working population that is shrinking relative to the number of retirees.

Pension Sponsorship and Participation: Summary of Recent Trends

Summary

According to the Census Bureau's *Current Population Survey (CPS)*, the number of private-sector workers between the ages of 25 and 64 whose employer sponsored a retirement plan rose from 51.2 million in 2006 to 53.5 million in 2007. The number of private-sector workers who participated in employer-sponsored retirement plans rose from 42.0 million in 2006 to 44.1 million in 2007. The proportion of 25 to 64 year-old workers in the private sector who participated in employer-sponsored retirement plans increased from 43.2% in 2006 to 45.1% in 2007. Between 2000 and 2007, the number of private-sector workers between the ages of 25 and 64 who participated in employer-sponsored retirement plans fell from 46 million to 44 million. The percentage of workers who participated in an employer-sponsored plan fell from 50.3% in 2000 to 45.1% in 2007.

A CRS analysis of the *Current Population Survey* indicates that, among private-sector workers aged 25 to 64 who were employed year-round, full-time:

- The percentage of workers whose employer sponsored a retirement plan rose from 57.2% in 2006 to 59.9% in 2007.
- The percentage of workers who participated in employer-sponsored retirement plans rose from 49.2% in 2006 to 52.0% in 2007.
- Only 25.5% of workers at firms with fewer than 25 employees participated in an employer-sponsored retirement plan in 2007, compared to 45.5% of workers at firms with 25 to 99 employees and 65.4% of workers at firms with 100 or more employees.
- Among men and women who were employed year-round, full-time, 51.6% of men and 52.6% of women participated in an employer-sponsored retirement plan in 2007.
- Only 43.0% of private-sector workers aged 25 to 34 and employed year-round, full-time participated in an employer-sponsored retirement plan in 2007, compared to 51.8% of workers aged 35 to 44, 57.4% of those aged 45 to 54, and 57.6% of those aged 55 to 64.
- Black, Hispanic, and other non-white workers were less likely to have participated in an employer-sponsored retirement plan. Fifty-eight percent of white workers participated in a company-sponsored retirement plan in 2007, compared to 47.1% of black non-Hispanic workers, 30.6% of Hispanic workers, and 48.5% of other non-white workers (mainly Asian-American and Native American workers).
- Only 27.7% of workers whose earnings were in the lowest quartile in 2007 (under \$27,000) participated in a retirement plan at work, compared to 69.2% of workers whose earnings were in the top quartile (above \$63,000).
- The percentage of part-time workers in the private sector whose employer sponsored a retirement plan rose from 37.8% in 2006 to 38.3% in 2007. Twenty-three percent of part-year or part-time workers in the private sector participated in an employer sponsored retirement plan in 2007, essentially unchanged from 2006.

Pension Sponsorship and Participation: Summary of Recent Trends

Background: Employment and an Aging Workforce

The aging of the American population has made retirement income an issue of increasing concern to the Congress and the public. Although Americans are living longer than ever before, most retire before age 65. Moreover, while the nation's population continues to grow, the decline in birth rates that followed the post-World War II "baby boom" and the continued lengthening of life spans will result in fewer workers relative to the number of retirees. These trends will affect the economic well-being of future retirees because pensions and Social Security benefits will be paid over longer periods of time; savings will have to be stretched over longer retirements; and Social Security benefits will have to be financed by a working population that is shrinking relative to the number of retirees.

Life Expectancy Continues to Increase

The average life expectancy of Americans born in 1960 was 69.7 years. It has been estimated that those who were born in 2005 will live for an average of 77.8 years.¹ A man who reached age 65 in 1960 could expect to live another 13.0 years, while a woman who turned 65 in 1960 had a remaining life expectancy of 15.8 years. A man who reached age 65 in 2005 could expect to live another 16.8 years, while a woman who turned 65 in 2005 had a remaining life expectancy of 19.8 years. As more people live into old age, the age-profile of the population will shift. In 1960, 16.7 million people in the United States, 9.2% of the population, were aged 65 or older. In 2005, there were 36.7 million Americans age 65 or older, representing 12.4% of the population. By 2025, according to projections made by the Bureau of the Census, there will be 63.5 million people aged 65 or older, comprising 18.2% of the U.S. population.

Labor Force Participation Begins to Drop After Age 55

The proportion of the population that is either working or looking for work is called the "labor force participation rate." As indicated by the data in **Table 1**, the labor force participation rate starts to drop significantly after age 55. When income is no longer derived from earnings, individuals depend more on pensions, interest and dividends, withdrawals from their savings, and — when they become eligible through age or disability — Social Security. The aging of the U.S. population will place

¹ U.S. National Center for Health Statistics, *Vital Statistics of the United States*.

strains on the components of the traditional “three-legged stool” of retirement income: Social Security, pensions, and personal saving.

Table 1. Labor Force Participation Rates in 2007

Age	Total Number of People (thousands)	Number in the Labor Force (thousands)	Labor Force Participation Rate (percent)
Men			
Age 25 to 54	62,081	56,408	90.9
— Age 45 to 54	21,313	18,801	88.2
Age 55 to 64	15,658	10,904	69.6
Age 65 and up	15,525	3,188	20.5
Women			
Age 25 to 54	63,615	47,945	75.4
— Age 45 to 54	22,231	16,896	76.0
Age 55 to 64	16,876	9,846	58.3
Age 65 and up	20,703	2,615	12.6

Congress and Retirement Income Policies

The Internal Revenue Code was first amended to provide favorable tax treatment for qualified pension and retirement plans in the 1920s. These provisions have been expanded and modified many times since then. Among the tax exemptions that apply to traditional “defined benefit” pension plans are the deduction of pension contributions from employer income, exclusion of employer contributions to pension plans from employee income, and tax exemption of the earnings of pension trusts.² In “defined contribution” plans such as those authorized under section 401(k) of the tax code, income taxes are deferred until retirement on employer and employee contributions to the plan and on the investment earnings of the plan.

By establishing the tax-favored status of pension programs and defining the terms under which tax exemptions and deductions are granted, federal tax law has both encouraged the growth of retirement plan coverage among workers and shaped the development of pensions and retirement savings plans. Congress also has sought to protect the pension benefits earned by workers through direct regulation of pension plans, most notably through the Employee Retirement Income Security Act of 1974 (ERISA, P.L. 93-406). ERISA, too, may have influenced the development of employer-sponsored retirement plans. Since its enactment, defined contribution (DC) plans have proliferated while the number of defined benefit (DB) plans has fallen.

² Defined benefit pensions are taxed when the employee receives benefits during retirement.

Two Kinds of Retirement Plans: Defined Benefit and Defined Contribution

Retirement programs are legally classified as either *defined benefit* plans or *defined contribution* plans. In defined benefit or “DB” plans, the retirement benefit usually is based on an employee’s salary and number of years of service. With each year of service, a worker accrues a benefit equal to either a fixed dollar amount per month or year of service or a percentage of his or her final pay or average pay.

A defined contribution or “DC” plan is much like a savings account maintained by the employer on behalf of each participating employee. The employer contributes a specific dollar amount or percentage of pay into the account, which is usually invested in stocks and bonds. In some plans, the size of the employer’s contribution depends on the amount the employee contributes to the plan. When the worker retires, the amount of the retirement benefit that he or she receives will depend on the balance in the account, which is the sum of all the contributions that have been made plus interest, dividends, and capital gains (or losses). The worker usually has the choice of receiving these funds as a lump sum, a series of fixed payments over a period of years, or in the form of a life annuity.

In recent years, many employers have converted their traditional pensions to *hybrid plans* that have characteristics of both DB and DC plans. The most popular of these hybrids has been the *cash balance plan*. A cash balance plan looks like a DC plan in that the accrued benefit is defined in terms of an account balance. The employer makes contributions to the plan and pays interest on the accumulated balance. However, in a cash balance plan, the account balances are merely bookkeeping devices. They are not individual accounts that are owned by the participants. At retirement, the employee must receive a benefit that is equal to the amount contributed to the plan plus the interest that has been credited to those contributions. Legally, therefore, a cash balance plan is a defined benefit plan.

Who Bears the Investment Risk? In a defined benefit plan, it is the *employer* who bears the investment risk of the plan, while in a defined contribution plan it is the *employee* who bears the investment risk. In a defined benefit plan, the employer promises to provide retirement benefits equal to a certain dollar amount or a specific percentage of the employee’s pay. The employer contributes money to a pension trust that is invested in stocks, bonds, real estate, or other assets. Retirement benefits are paid from this trust fund. The employer is at risk for the amount of the retirement benefits that have been promised to employees and their survivors. If there are insufficient funds in the pension trust to pay the accrued benefits, the firm that sponsors the pension plan is legally obligated to make up the difference by paying more money into the pension fund. This can be done over a period of years.

In a defined contribution plan, the employer bears no risk beyond an obligation to make contributions to each employee’s retirement account. In these plans, it is the *employee* who bears the risk that his or her retirement account will increase in value by an amount sufficient to provide adequate income during retirement. If the contributions made to the account by the employer and the employee are insufficient, or if the securities in which the account is invested lose value or increase in value too

slowly, the employee risks having an income in retirement that is not sufficient to maintain his or her desired standard of living. If this situation occurs, the worker might choose to delay retirement.

Many factors affect a firm's decision to sponsor a retirement plan and a worker's decision to participate in the plan. In any given year, changes in the business climate — inflation, interest rates, wage increases, the cost of other benefits (such as health insurance), trends in business revenues and profits — could weigh more heavily in a firm's decision to establish or continue a retirement plan than the potential tax advantages it could gain by sponsoring a plan. Likewise, an employee's decision to participate or not to participate in a retirement plan may be affected by such variables as the rate of growth of wages, the rising cost of employee health insurance premiums, his or her confidence in the financial status of Social Security, and whether another family member already participates in a retirement plan.

Encouraging sponsorship of retirement plans by small firms is an important issue to the Congress in part because of the large number of people employed by small businesses. In 2007, for example, more than 36 million wage and salary workers were employed by firms with fewer than 25 employees.³ The relatively low rates of employer sponsorship and employee participation in retirement plans at small businesses have prompted Congress to look for ways to make it easier for small employers to establish and maintain retirement plans for their employees. Because small employers may be reluctant to take on the financial risk and administrative burden of establishing a defined-benefit pension plan, Congress has sought to encourage greater retirement plan sponsorship among small businesses mainly by easing the financial and reporting requirements associated with certain types of defined contribution pension plans. The Revenue Act of 1978 (P.L. 95-600) authorized a defined contribution plan called the Simplified Employee Pension (SEP).⁴ The Small Business Job Protection Act of 1996 (P.L. 104-188) authorized another type of defined contribution plan called the Savings Incentive Match Plan for Employees (SIMPLE). Nevertheless, rates of retirement plan sponsorship and participation in small firms continue to lag behind the rates achieved in larger firms.

The Number of Defined Benefit Plans Is Declining

According to the Pension Benefit Guaranty Corporation (PBGC), the number of PBGC-insured defined benefit plans fell from 114,396 in 1985 to 30,328 in 2006.⁵ The decline in the number of DB plans resulted mainly from the termination of a large number of small plans. Between 1985 and 2006, the number of single-employer defined benefit pension plans with fewer than 100 participants fell from

³ Full-time and part-time wage and salary workers. (Source: *Current Population Survey*.)

⁴ P.L. 95-600 authorized tax exemption only for employer contributions to a SEP. The Tax Reform Act of 1986 (P.L. 99-514) allowed workers in firms with fewer than 25 employees to contribute to a SEP on a tax-deferred basis through salary reduction (SARSEP). P.L. 104-188 authorized SIMPLE plans to replace SARSEPs. Firms may continue to establish SEPs funded exclusively by employer contributions, but new SARSEPs were prohibited after December 31, 1996. Previously existing SARSEPs may continue as before.

⁵ Pension Benefit Guaranty Corporation, *Pension Insurance Data Book 2006*.

90,061 to 18,199, a decline of 80%. The number of large DB plans fell from 22,147 to 10,585, a decline of 52.2%. In recent years, however, several large pension plans have been terminated, and others have been “frozen” so that participants no longer accrue pension benefits.

Recent Trends in Retirement Plan Sponsorship and Participation

Every month, the Bureau of the Census conducts the *Current Population Survey* (CPS) among a nationally representative sample of approximately 100,000 households, primarily for the purpose of estimating the rates of employment and unemployment. During March of each year, the survey includes supplemental questions about employment, income, health insurance, retirement plan participation, and receipt of government benefits during the previous calendar year. This information allows analysts and researchers to calculate the number and percentage of workers who reported whether their employer offered a retirement plan and whether they participated in the plan. Responses can then be categorized by demographic and economic characteristics, such as the worker’s age, race, sex, income, and the size of firm at which they worked. Unfortunately, however, because the CPS asks only two pension-related questions — if the worker’s employer offered a retirement plan and if the worker was included in the plan — we cannot ascertain whether the plan is a defined benefit plan or a defined contribution plan.

Plan Participation by Full-Time vs. Part-Time Employment

Table 2 compares retirement plan participation among year-round, full-time wage and salary workers in the private sector with participation among workers who were employed part-year or part-time. Workers with part-year or part-time employment are much less likely to be employed by a firm that sponsors a retirement plan. Part-time and part-year workers also are less likely to participate if their employer sponsors a plan.

The proportion of year-round, full-time workers employed at firms that sponsored a retirement plan increased from 57.2% in 2006 to 59.9% in 2007. The participation rate among these workers rose from 49.2% in 2006 to 52.0% in 2007. Between 1990 and 2000, plan participation among full-time workers increased from 54.6% to 57.4%. It has since fallen by about five percentage points. Between 2006 and 2007, the proportion of part-time or part-year workers employed by firms that sponsored a retirement plan rose from 37.8% to 38.3%. The participation rate among part-year and part-time workers whose employer sponsored a retirement plan was essentially unchanged from 2006 to 2007, at approximately 23% in both years.

The lower rate of retirement plan participation among part-year and part-time workers is one of the reasons that women are less likely than men to participate in a company-sponsored retirement plan. There is little difference in retirement plan participation between men and women who work year-round, full-time. (See **Table 4**.) Women, however, are more likely than men to work part-year or part-time. In 2007, 82.7% of working men between the ages of 25 and 64 were employed year-

round, full-time compared to 68.7% of working women in this age-group. Consequently, although women who worked full-time in 2007 were as likely as their male counterparts to have participated in a retirement plan (52.6% of women vs. 51.6% of men), the retirement plan participation rate among all women 25 to 64 years old in the private sector in 2007 was lower than the participation rate among all working men in that age group.⁶ (43% of women participated vs. 47% of men.)

**Table 2. Participation in Retirement Plans
by Full-Time vs. Part-Time Employment**

(Private-sector wage and salary workers, ages 25 to 64)

	Workers (thousands)	Employer Sponsors Plan		Employees Participating	
		Workers	Percent	Participant	Percent
Full-Time

⁶ CRS estimates based on the March 2008 CPS (not shown in accompanying tables).

Retirement Plans and Employer Size

Data from the CPS show that retirement plan participation in small firms rose between 1990 and 2000, but has recently declined. The CPS data also indicate that access to a company-sponsored retirement plan remains substantially lower in small firms than in firms with 100 or more employees. The data displayed in **Table 3** show that from 1990 to 2007, the number of workers between the ages of 25 and 64 who were employed in the private sector and worked year-round, full-time at firms of all sizes increased from 53.0 million to 74.6 million. At the same time, the number of such workers whose employer offered a retirement plan increased from 33.3 million to 44.6 million. The proportion of year-round, full-time workers who were employed at firms that offered a retirement plan rose from 62.8% in 1990 to 66.3% in 2000. It has since fallen to 59.9%.

The data displayed in **Table 3** show that since 2000, the proportion of workers in firms with 100 or more workers whose employer sponsors a retirement plan has fallen from 80.5% to 75.2%. Nevertheless, workers at large firms remain substantially more likely than employees of small businesses to work for an employer that sponsors a retirement plan. In 2007, 29.3% of full-time workers in businesses with fewer than 25 employees were employed at firms that sponsored a retirement plan, down from 34.2% in 2000. This was still higher than the 25.4% of workers at small firms whose employer sponsored a retirement plan in 1995. Among workers in firms with 25 to 99 employees, 53.1% were employed at firms that sponsored a retirement plan in 2007, compared to 58.5% in 2000 and 54.1% in 1995.

Table 3 also shows the percentage of year-round, full-time employees in the private sector who participated in an employer-sponsored retirement plan.⁷ This statistic takes into account the impact of employers that do not sponsor a plan on overall retirement plan participation rates. Among firms of all sizes, the proportion of year-round, full-time employees between the ages of 25 and 64 who participated in a retirement plan rose from 49.2% in 2006 to 52.0% in 2007. This was lower than the participation rates of 57.4% in 2000 and 54.9% in 1995. In firms with fewer than 25 employees, just 25.5% of full-time employees between the ages of 25 and 64 participated in a retirement plan in 2007, down from 29.3% in 2000, but higher than the 21.3% who participated in a plan in 1995. In firms with 25 to 99 employees, retirement plan participation rose from 42.6% in 2006 to 45.5% in 2007. This was lower than the participation rates of 49.4% in 2000 and 46.0% in 1995. Participation in retirement plans among workers in firms with 100 or more employees also rose between 2006 and 2007, increasing from 62.7% to 65.4%. This was about five percentage points lower than the participation rates of 70.2% in 2000 and 70.4% in 1995.

⁷ Not all employees whose employer sponsors a retirement plan are eligible to participate. For example, employees under age 21, those who have been employed for less than one year, and those who work fewer than 1,000 hours in a year can be excluded from the plan.

Table 3. Participation in Retirement Plans by Size of Firm
 (Private-sector wage and salary workers, ages 25 to 64, employed year-round, full-time)

Size of Firm	Workers (thousands)	Employer Sponsors Plan		Employees Participating	
		Workers	Percent	Participants	Percent
Under 25 Employees					
1990	12,119	3,042	25.1	2,619	21.6
1995	14,627	3,715	25.4	3,109	21.3
2000	16,591	5,575	34.2	4,857	29.3
2001	17,061	5,788	33.9	4,965	29.1
2002	17,878	5,658	31.7	4,880	27.3
2003	18,616	5,850	31.4	5,064	27.2
2004	18,906	5,795	30.7	5,016	26.5
2005	19,200	5,569	29.0	4,851	25.3
2006	19,406	5,160	26.6	4,434	22.9
2007	19,449	5,702	29.3	4,954	25.5
25 to 99 Employees					
1990	7,892	3,904	49.5	3,291	41.7

Plan Participation Among Men and Women

Table 4 shows the rates of participation in employer-sponsored retirement plans by men and women between the ages 25 and 64 who were employed in the private sector and worked year-round, full-time. Between 1990 and 2000, the proportion of men whose employer sponsored a retirement plan rose from 63.3% to 66.2%. Since then, it has dropped to 59.1%. The proportion of women who worked at firms that sponsored a retirement plan increased from 62.1% in 1990 to 66.4% in 2000. In 2007, 61.0% of women who worked year-round, full-time were employed at firms that sponsored a retirement plan. Thus, in 2007 women who were employed year-round, full-time were more likely than men to have worked for an employer that sponsored a retirement plan. Men and women, however, were almost equally likely to have participated in an employer-sponsored retirement plan. In 2007, 51.6% of men who were employed year-round, full-time participated in a company-sponsored retirement plan, compared to 52.6% of women. Both of these participation rates were lower than the 2000 participation rates of 58.3% for men and 56.1% for women. The participation rate for men was 6.7 percentage points lower in 2007 than in 2000. The participation rate for women was 3.5 percentage points lower in 2007 than in 2000.

Plan Participation by Employee Age

Table 5 displays rates of participation in employer-sponsored retirement plans among workers who were employed in the private sector and worked year-round, full-time, according to their age. Young workers — ages 25 to 34 — were less likely than middle-aged and older workers to be employed at a firm that sponsored a retirement plan in 2007. They also were less likely to participate in retirement plans than are older workers. In 2007, 54.3% of workers 25 to 34 years old worked for an employer that sponsored a retirement plan, and 43.0% of workers in this age group participated in a company-sponsored plan. Thus, 79.2% of those aged 25 to 34 who worked for a firm that sponsored a plan participated in the plan ($0.430/0.543 = 0.792$). In contrast, among workers 55 to 64 years old, 63.5% worked at firms that sponsored a retirement plan, and 57.6% participated in a company-sponsored plan. Thus, among workers aged 55 to 64 who worked for a firm that sponsored a retirement plan, 90.7% participated in the plan ($0.576/0.635 = 0.907$).⁸

⁸ Some of the difference in participation rates is because workers under 35 are somewhat more likely to be in their first year with an employer and can be excluded from participating in the plan. Employees who work fewer than 1,000 hours in a year and those under age 21 also can be excluded from participating, but neither group is represented in Table 5.

Table 5. Employee Participation in Retirement Plans, by Age

Plan Participation by Employee Race

The March 2003 CPS introduced newly expanded categories of race and ethnicity, making comparisons with prior years problematic. In **Table 6**, race and ethnicity are categorized as white non-Hispanic, black non-Hispanic, Hispanic, and other. The “other” category includes mainly persons whose heritage is Asian, Native American, Eskimo, or Pacific Islander. In 2007, the likelihood of being employed at a firm that sponsored a retirement plan was highest for white non-Hispanic workers and lowest for Hispanic workers. Black non-Hispanic workers and “Asian/Other” workers were about equally likely to have worked for an employer that sponsored a retirement plan. Among white non-Hispanic workers, 65.4% worked for an employer that sponsored a retirement plan, and 57.6% participated in an employer-sponsored plan. Among Hispanic workers, just 37.5% worked for an employer that sponsored a retirement plan and only 30.6% participated in an employer-sponsored retirement plan. Of workers who classified their race and ethnicity as black non-Hispanic, 57.6% worked for an employer that sponsored a plan and 47.1% participated in a plan, while among Asian-American and other workers, 55.4% worked for an employer that sponsored a retirement plan and 48.5% participated in a plan.

Table 6. Employee Participation in Retirement Plans, by Race
(Private sector wage and salary workers, ages 25 to 64, employed year-round, full-time)

Employee Race	Workers (thousands)	Employer Sponsors Plan		Employees Participating

Plan Participation by Employee Earnings

Table 7 shows the relationship between earnings and participation in an employer-sponsored retirement plan. In **Table 7**, workers' annual earnings from wages and salaries — as reported on the Current Population Survey — are ranked by quartile. In 2007, one-quarter of private-sector wage and salary workers between the ages of 25 and 64 who were employed year-round, full-time earned more than \$63,000. Another quarter had earnings between \$40,000 and \$63,000. The next quarter had earnings between \$27,000 and \$40,000, and those in the lowest quartile earned less than \$27,000.

In 2007, 73.8% of year-round, full-time workers in the private sector with annual earnings in the top quartile were employed by firms that sponsored a retirement plan, and 69.2% of workers in the top earnings quartile participated in a retirement plan. Both of these percentages were lower than the rates in 2000 and 1995. In 2000, 80.2% of year-round, full-time workers in the private sector with annual earnings in the top quartile were employed by firms that sponsored a retirement plan, and 75.5% of workers in the top earnings quartile participated in a retirement plan. The equivalent sponsorship and participation rates in 1995 were 77.1% and 73.0%, respectively.

The percentage of workers employed at firms that sponsored a retirement plan and the percentage who participated in these plans were progressively lower in each of three lowest earnings quartiles. For example, among workers in the lowest earnings quartile in 2007, 38.4% were employed at firms that sponsored a retirement plan, and 27.7% of workers in the bottom quartile participated in a retirement plan. Both of these percentages were lower than the comparable rates in 2000 and 1995. In 2000, 44.9% of year-round, full-time workers in the private sector with annual earnings in the bottom quartile were employed by firms that sponsored a retirement plan, and 32.1% of workers in the bottom earnings quartile participated in a retirement plan. The equivalent sponsorship and participation rates in 1995 were 42.4% and 30.4%, respectively.

Low-wage workers are not only less likely to work for an employer that sponsors a retirement plan; they also are less likely to participate if a plan is offered. Among employees whose earnings in 2007 were in the top quartile, 73.8% worked for an employer that sponsored a retirement plan and 69.2% participated in a retirement plan. Therefore, the participation rate among employees in the top earnings quartile whose employer sponsored a retirement plan was 93.8% ($0.692/0.738 = 0.938$). Among workers whose 2007 earnings were in the bottom quartile, only 38.4% worked for an employer that sponsored a retirement plan and just 27.7% participated in a retirement plan. Thus, the participation rate among low-wage employees whose employer sponsored a retirement plan was 72.1% ($0.277/0.384 = 0.721$).

Table 7. Participation in Retirement Plans by Annual Earnings
(Private-sector wage and salary workers, ages 25 to 64, employed year-round, full-time)

Worker's Annual Earnings	Employer Sponsors Plan	Employee Participates
	Percentage of Workers	Percentage of Workers

Another Measure of Retirement Plan Participation: The National Compensation Survey

The Bureau of Labor Statistics collects data from employers about paid leave, health insurance, retirement plan participation, flexible spending accounts, and other employee benefits as part of the *National Compensation Survey* (NCS). This survey is conducted among a nationally representative sample of private-sector business establishments.⁹ The term *establishment* usually refers to a single place of business at a particular location or all branches of a business in a particular metropolitan area or county. An establishment might be a branch or small operating unit of a larger firm. In contrast, a *firm* comprises all of the establishments that together form a corporation, partnership, or other business entity.¹⁰

According to the data collected from employers through the National Compensation Survey, 51% of workers in the private sector participated in employer-sponsored retirement plans in March 2007. (See **Table 8**.) Twenty percent of private-sector workers participated in defined benefit plans and 43% participated in defined contribution plans. Approximately 12% of private-sector workers participated in both types of plan. The NCS indicates that 66% of employees in establishments with 100 or more workers participated in an employer-sponsored retirement plan in March 2007, while only 37% of employees at establishments with fewer than 100 employees participated in an employer-sponsored retirement plan. The data from the NCS also indicate that among full-time workers, 60% participated in an employer-sponsored retirement plan in March 2007, compared to just 23% of part-time workers.

While it is not necessarily surprising that the results of the NCS differ from those of the CPS, nor that the NCS shows higher rates of participation, it is important to note that in recent years the difference in the results shown by the two surveys has increased because the NCS has indicated a generally steady rate of retirement plan participation whereas the CPS data indicate that retirement plan participation has been falling. As recently as 2003, the NCS indicated that 49% of private-sector workers participated in a retirement plan whereas the CPS data showed a participation rate of 47%. This two percentage point difference was small enough to be inconsequential for most analytical purposes. The slightly higher rate of participation indicated by the NCS might partly be due to the fact that the business owners and benefits specialists who are interviewed for the NCS could be expected to have greater knowledge of employer-provided benefits than the household members interviewed for the CPS. By March 2007, however, the NCS indicated that the proportion of private-sector workers participating in employer-sponsored retirement plans was 51%, whereas the March 2008 CPS (which asks about pension participation in 2007) showed that participation in retirement plans among private sector workers had fallen to 45%. The difference in the results shown by the two surveys can no longer be considered inconsequential, leaving

⁹ For more information on the National Compensation Survey, see U.S. Department of Labor, *National Compensation Survey: Employee Benefits in Private Industry in the United States, March 2007*, available online at [<http://www.bls.gov/ncs/ebs/sp/ebsm0006.pdf>].

¹⁰ In the Census Bureau's *Current Population Survey*, employer characteristics are reported at the level of the firm, which may include more than one establishment.

analysts to question whether one or both surveys have problems related to sample selection or survey methodology.
